Classification of wanted e-mail via web of relationship utilization of Public Key Infrastructure (PKI)

Abstract

An enhanced email system that will allow for categorization of wanted email based on relationships between senders and receivers. Modified email servers and clients will deliver and/or sort email based on defined relationships between senders and receivers or intermediaries and the receivers preferences. This means email delivery or sorting is based on a web of relationship. Support for encryption to multiple members of a group is supported by a system of dynamic delivery and maintenance of group keys.
